

Acuant WebID™

Verify Identities Over the Web:
Seamless HTML Workflow

Instant Identity Verification for Cross-Channel Workflows

Acuant WebID™ allows users to seamlessly verify their identity across channels utilizing both **Acuant AssureID™** & **Acuant FaceID™** via HTML (desktop) and their mobile device. This allows businesses to onboard consumers and verify identities any way they choose: start the process on premise, on a desktop, mobile/app or kiosk, then verify your identity via your mobile phone.

How It Works

The user is sent a unique link via text message or email from the verifying institution. The link immediately opens the WebID mobile browser app which instructs the user to capture their ID and then take a selfie. The authentication of the ID and facial recognition match with liveness test happen in real time and allow businesses to follow the progress and see where users might abandon the process. This allows for the best results in passing more good customers and catching fraud.

Benefits

- Off-the-Shelf with Easy API Integration & White Labeling
- Captures High Quality Images to Reduce Unknown Rates
- Facial Recognition Liveness Detection on the Web
- Multi-Factor Authentication Across Devices, Any Channel
- Ability to Track User Abandonment

Identity verification made simple, nothing to download, no app to install, easy to follow mobile browser experience - WebID provides businesses a superior way to transact with trust online.

Use Cases

Multi-Factor
Authentication

Verification for
Desktop/HTML Workflows
